Multiple Linear Regression – Simple Code and Diagram Output

Source Code

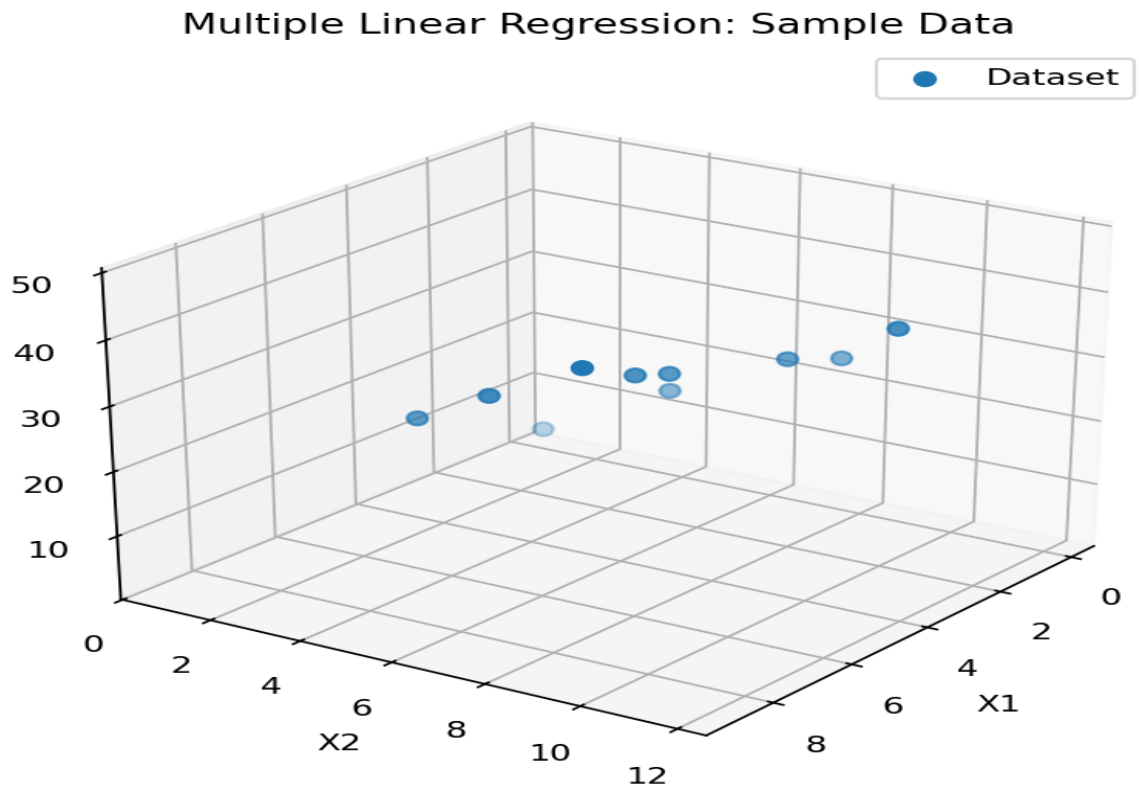

```
import numpy as np
import matplotlib.pyplot as plt

n = 10
x1 = np.arange(n)
x2 = x1 / 2 + np.random.rand(n) * n
y = 2 * x1 + 3 * x2 + 1

fig = plt.figure()
ax = fig.add_subplot(projection="3d")
ax.scatter(x1, x2, y, s=10)
ax.set_xlabel("X1")
ax.set_ylabel("X2")
ax.set_zlabel("Y")
plt.show()

print("Dataset generated successfully")
```

Diagram Output

Output message: Dataset generated successfully

Note: The plot shows sample data with two input variables (X1 and X2) and output (Y). This code generates and plots data; it does not train a regression model.
